

# Introduction to Coastal Blue Carbon Concepts

Stefanie Simpson

Estuarine Research Center, Port Aransas, TX

November 5, 2015

RESTORE  
AMERICA'S  
ESTUARIES

# Who we are

A blue silhouette of the United States map is centered on a white background. The map is overlaid with several logos and text. In the top left, there is a gold circular logo for 'EARTH CORPS'. On the West Coast, there is a logo for 'SAVE BAY' featuring the Golden Gate Bridge. In the center of the map, the text reads: 'Our mission is to preserve the nation's network of estuaries by protecting and restoring the lands and waters essential to the richness and diversity of coastal life.' On the East Coast, there is a red 'SAVE THE BAY.' logo, a 'clf' logo, a 'Save the Bay' logo with a fish, a logo with a bird, and the 'North Carolina Coastal Federation' logo with a yellow bird. At the bottom of the map, there is a logo for 'TAMPA BAY WATCH' and another logo with a bird.

# Outline

1. Why Blue Carbon
2. Greenhouse gases and tidal wetlands
3. GHG markets and methodologies
4. Blue Carbon approaches

# We care about estuaries!

# U.S. Coastal Habitat Losses and Response

# A “New” Ecosystem Service

## “Blue Carbon”

the greenhouse gases (GHGs) stored in, sequestered by, and released by coastal marine ecosystems such as seagrasses, mangroves, salt marsh and other tidal wetlands.

Goal: Increase public and private investment in coastal habitat restoration and conservation.

# Coastal Blue Carbon at the Nexus

Restoration /  
Conservation

Coastal  
Blue Carbon

Mitigation

Adaptation

# Relevant Greenhouse Gases (GHGs)

CO<sub>2</sub>: Sequestered by plants and stored in plant material and soil

N<sub>2</sub>O: Production is anthropogenic in wetlands and estuaries, x300

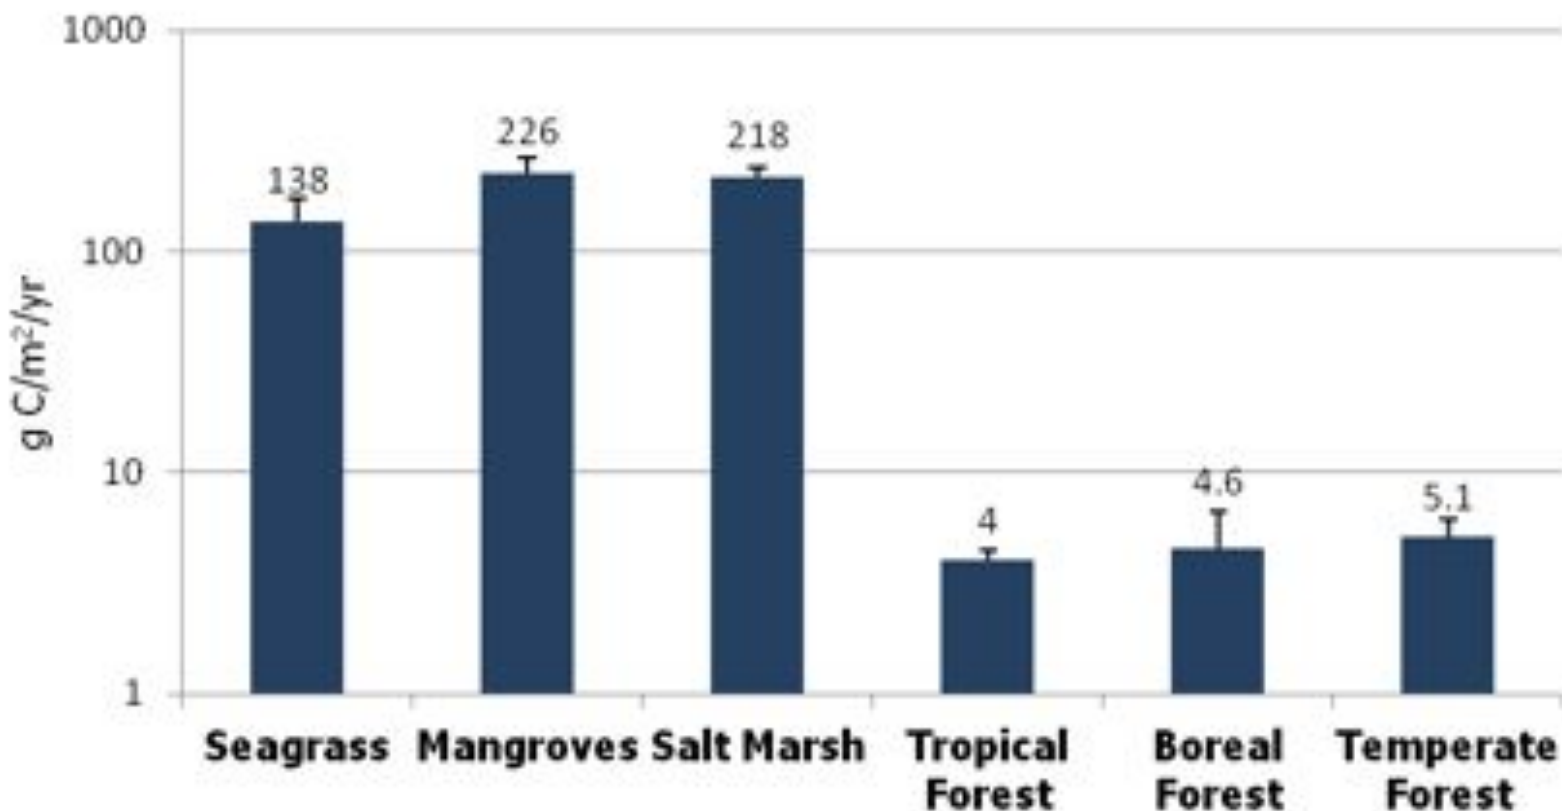

CH<sub>4</sub>: Highly variable at <18 ppt salinity  
Insignificant above 18-20 ppt, x 21 - 34

# What Is Blue Carbon?

## Soil Carbon Accumulation Rates

Source: Mcleod et al. (2011)

# What Is Blue Carbon?

## Primary Carbon Storage in Soils

Soil carbon  
values for 1<sup>st</sup>  
meter of depth  
only  
(total depth =  
several meters)

Source: Pendleton et al. (2012) and Pan et al. (2011)

# Carbon Comparisons

Hummer driving 15,000 miles emits **11 tons CO<sub>2</sub>e** (carbon dioxide equivalents)

Prius driving 15,000 miles emits **3.7 tons CO<sub>2</sub>e**

....while just 1 hectare of Salt Marsh **REMOVES 8 tons CO<sub>2</sub>e** every year.

# Global Habitat Loss

- Global habitat loss 0.7-7% per year
- Half a billion tons CO<sub>2</sub> released annually (equivalent to Canada's yearly emissions\*)

# How much progress are we making?

1. Historic Loss >> 1,496,079 acres
2. Combined Goals >> 646,800 acres (59% of loss)
3. 2009-2012 annual average restored ~6,959 acres
4. Annual restoration rate ~1.08% of total goal
5. Average coastal wetland losses of 80,000 acres/yr

# RAE Blue Carbon Strategy

## Introduction into Carbon Markets

VCS Requirements

Restoration Methodology

*Conservation Methodology*

*Demonstration projects*

## Support Science

Snohomish Estuary Assessment

Tampa Assessment

## Explore Policy and Regulatory Options

e.g. 'Carbon reserves'

## Coordinate Blue Carbon Initiatives

e.g. National Working Group

## Raise Awareness and Build Capacity

# How Much Blue Carbon Is in an Estuary?

## Snohomish Estuary, Puget Sound, WA

- Current restoration plans:  
2.55 million tons CO<sub>2</sub>  
1-year emissions 500,000 cars
- Full restoration 4700 ha:  
**8.9 million tons CO<sub>2</sub>**  
1-year emission 1.7 million cars

## Coastal Blue Carbon Assessment for the Snohomish Estuary: The Climate Benefits of Estuary Restoration

<https://www.estuaries.org/bluecarbon-science>

## Bringing Wetlands to Market

- Quantify GHG emissions and C sequestration in salt marshes
- Understand processes to predict fluxes with change
- Develop user-friendly model for managers and policy makers
- Develop market tools

# Activities with Potential GHG Benefits

Restoration of tidal wetlands and seagrasses

Creation of tidal wetlands (e.g. beneficial use, lowering water table)

Conservation/avoided loss of existing tidal wetlands and seagrass beds

# Restoration Scenarios

Levee/dike breach to restore salt marsh on former agricultural land

*Petaluma Marsh Expansion*

*The Breaching of the Levee*

*December 8, 2006*

# Scenario: Levee Breach

|                                | $\text{CO}_2$              | $\text{CH}_4$ | $\text{N}_2\text{O}$ |
|--------------------------------|----------------------------|---------------|----------------------|
| <b>Baseline</b>                | Drained soils = emissions. |               |                      |
| <b>“With Project Scenario”</b> |                            |               |                      |

# Scenario: Levee Breach

|                                | $\text{CO}_2$              | $\text{CH}_4$          | $\text{N}_2\text{O}$ |
|--------------------------------|----------------------------|------------------------|----------------------|
| <b>Baseline</b>                | Drained soils = emissions. | Wet soils = emissions. |                      |
| <b>“With Project Scenario”</b> |                            |                        |                      |

# Scenario: Levee Breach

|                                | <b>CO<sub>2</sub></b>      | <b>CH<sub>4</sub></b>  | <b>N<sub>2</sub>O</b>   |

| <b>“With Project Scenario”</b> | No emissions. Restore C sequestration.      | ?                     | ?                     |

# Carbon Offsets

## Carbon Offsets

Offsets represent emission reductions that have been achieved outside of the capped sector.

1 Company A needs to meet its emissions cap

2 Company A invests in an emission reduction project that produces carbon offsets

INVESTMENT

3 Company A receives carbon credits for its investment

CARBON OFFSET

One carbon credit = One tonne of greenhouse gas emission reduction

Carbon offsets programs can include:

- + Reforestation
- + Renewable energy
- + Methane capture/avoidance

# Compliance Markets

**REQUIRES private sector participation by capping emissions**

- California Global Warming Solutions Act
- Regional Greenhouse Gas Initiative (New England states)

# CA's Global Warming Solutions Act

- Reduce state's GHG emissions to 1990 levels by 2020
- All major industries and 85% of emissions sources
- 2<sup>nd</sup> largest compliance market in the world
- CA ARB auctions allowances, proceeds of > \$500 million
- Allows offsets up to 8% of obligation (but no wetlands.. yet)
- \$25 million invested in wetlands and watershed restoration

Auction for Allowances

Purchase offset credits

# CA's Global Warming Solutions Act

- Allows offsets, up to 8% of obligation
- Five approved offset types: livestock, destruction of ozone depleting substances from US projects, US forestry and urban forestry, and coal mine methane
- Considering rice cultivation and Reduced Emissions from Deforestation and Degradation (REDD) forest projects from Brazil and Mexico

Sources: Ecosystem Marketplace and EDF

# Regional Greenhouse Gas Initiative

- 9 NE states
- In addition to allowances, RGGI allows offsets:
  - Improved forest mgmt, avoided conversion/ reforestation, consistent with ARB
  - landfill CH<sub>4</sub> capture & destruction
  - sulfur hexafluoride reduction in the electricity sector
  - avoided agricultural CH<sub>4</sub> emissions and
  - energy-efficient building projects

Sources: Ecosystem Marketplace

# Voluntary Carbon Market

- \$78 million in N. America-2013
- Anticipated growth of 300% by 2020
- 45% of offsets are from forestry/land use
- Verified Carbon Standard largest issuer, 47%

Market Share and Value by Project Category, 2013. Ecosystem Marketplace.

# Voluntary Carbon Market

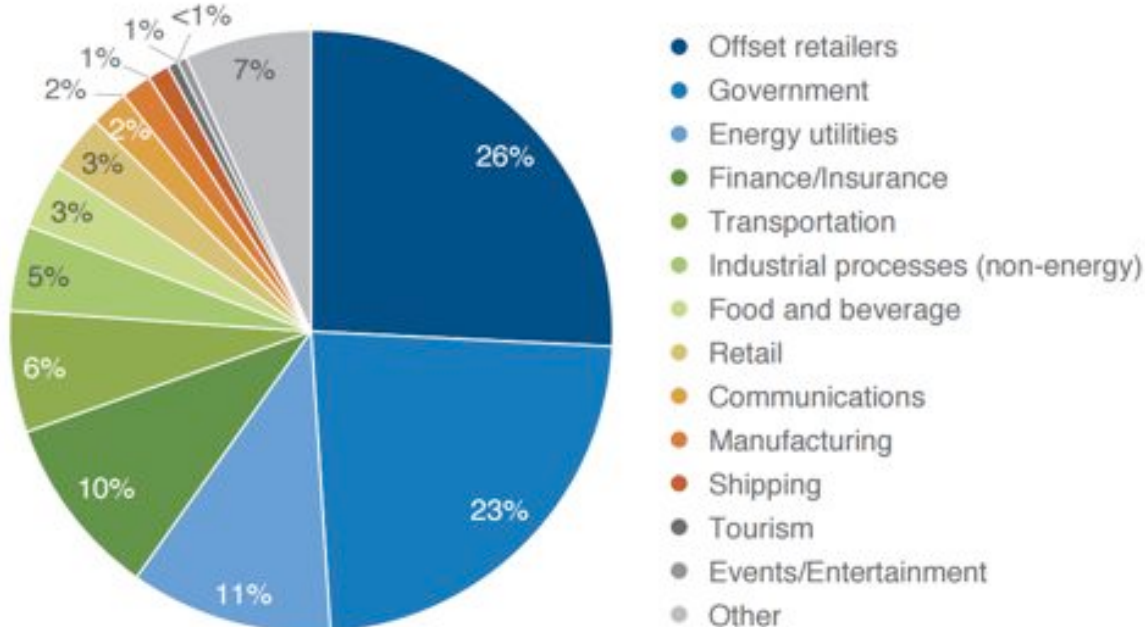

Offset End Users' Top Offsetting Motivations, 2013. Ecosystem Marketplace

| Motivation                                 | Ranking by % Share |
|--|--------------------|
| Climate-driven mission                     | 20%                |
| Corporate Social Responsibility            | 19%                |
| Demonstrating climate leadership           | 14%                |
| Engaging customers/clients                 | 10%                |
| Incentivizing supply chain practice change | 2%                 |

## Who is buying and why?

Market Share by Buyer Sector, 2013. Ecosystem Marketplace

**Standards** ensures quality and integrity of carbon offsets

- General requirements & guidance on GHG accounting
- Procedures for validation and verification

**Registries** ensure credits are tracked, prevent double-counting

# Project Requirements

|              |  |
|--------------|--|
| Real         | Demonstrate that reductions have actually occurred   |
| Additional   | Ensure reductions result from activities that would have not happen in absence of GHG market |
| Permanent    | Mitigate risks of reversals  |
| Verified     | Provide for independent verification that emissions are real                                 |
| Not harmful  | Avoid negative externalities   |
| Practicality | Minimize project implementation barriers   |
| Ownership    | Ownership of GHG reductions must be clear  |

Methodologies provide step-by-step requirements for quantifying GHG benefits following scientific good practice

## Agriculture, Forestry and Other Land Uses (AFOLU) Category

- Afforestation, Reforestation, Revegetation (ARR)
- Agricultural Land Management (ALM)
- Improved Forest Management (IFM)
- Reduction Emissions from Deforestation and Degradation (REDD)
- Avoided Conversion of Grasslands and Shrublands (ACoGS)
- Wetlands Restoration and Conservation (WRC) – **2012**

# VCS – AFOLU Requirements

- Project Requirements
- Methodology Requirements
- Validation and Verification Requirements

VCS Version 3  
Requirements Document  
1 February 2012, v3.2

# Market Opportunities

WRC Requirements

Methodology  
Development

Project  
Development

GHG Emission  
Reductions and  
Removals

# Wetland Methodologies

- Coastal Wetland Creation (VCS) – LA CPRA
- Restoration of Degraded Wetlands of the MS Delta (ACR) – Tierra Resources
- Global Tidal Wetland and Seagrass Restoration Methodology (VCS) – RAE (*approval imminent*)
- Global Tidal Wetland and Seagrass Conservation Methodology – initiated by RAE

# Tidal Wetland and Seagrass Restoration Methodology

## Habitats – all tidal wetlands and seagrasses, globally

- Marshes, all salinity ranges
- Mangroves
- Seagrasses
- Forested tidal wetlands

## Eligible Activities

- Restoration via enhancing, creating and/or managing hydrological conditions, sediment supply, salinity characteristics, water quality and/or native plant communities.

## Additionality

- Standardized approach: **In U.S., all voluntary tidal wetland restoration is additional (!)**
- Seagrass restoration and non-US projects must follow project tool

# Tidal Wetland and Seagrass Restoration Methodology

- Submitted to Verified Carbon Standard December 2013
- Draft available at [www.v-c-s.org](http://www.v-c-s.org), search “wetland”
- Final approval 2015

## Authors

- Dr. Igino Emmer, Silvestrum
- Dr. Brian Needelman, University of Maryland
- Steve Emmett-Mattox, RAE

# Greenhouse Gas Accounting

## Greenhouse Gas Flux

$\text{CO}_2$

- Biomass
- Soils
- Fuel emissions

Methane ( $\text{CH}_4$ )

Nitrous Oxide ( $\text{N}_2\text{O}$ )

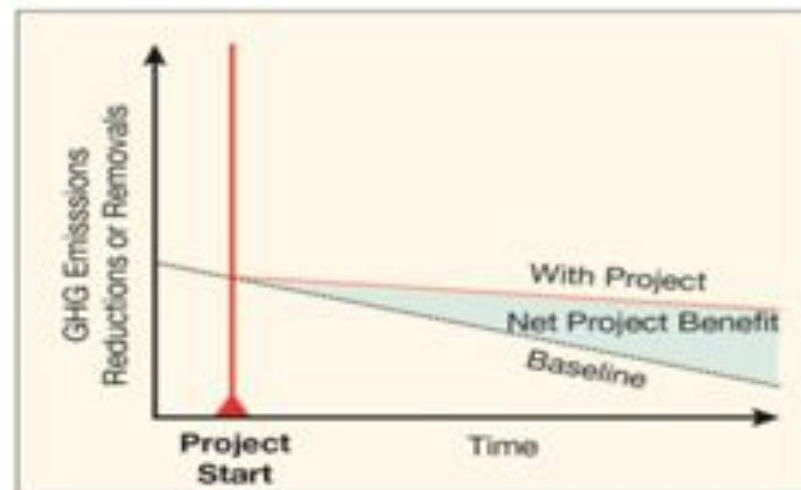

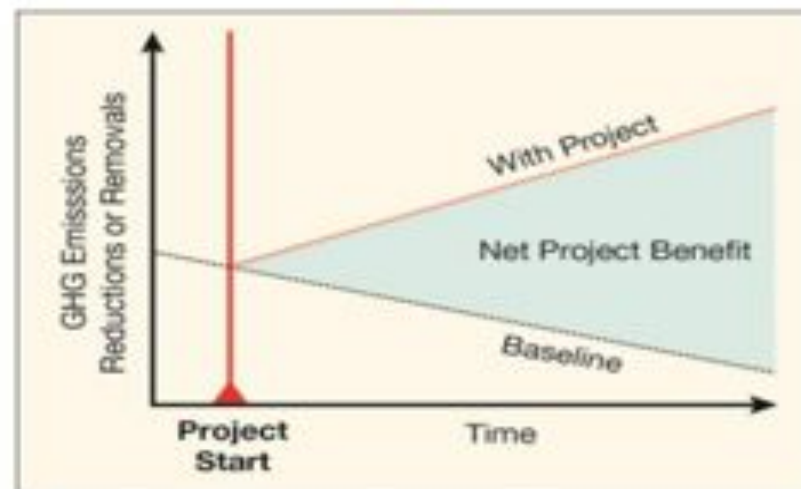

Account for baseline and with-project scenarios

→ **Feasibility Study**

# Scenarios for GHG Benefits

## Baseline versus with-project scenario

# Applicability Conidtions

- No leakage (activity shifting or market)
- Lowering of the water table limited to:
  - Open water conversion
  - Maintain wetland conditions
- No N fertilizers

# Greenhouse Gas Accounting

- Published data
- Default values  
1.46 Mg C / ha / year for marshes and mangroves
- Emission factors
- Field-collected data
- Proxies
- Models

Where science is insufficient,  
burden of proof is on  
project developers to  
demonstrate

# Project Development

- ✓ Identify appropriate methodology
- ✓ Feasibility Study to verify carbon benefit

**Evaluate  
potential  
opportunities**

*What are my  
options?*

**Feasibility  
Assessment  
based on VCS  
Restoration  
Methodology**

*Is this a good offset  
project? What do we  
need to do?*

**Implement  
Project**

*Promote GHG  
benefits of project.  
Make it happen!  
Get credit!*

# Project Development

## Guidance document

- Assist with project development
- How to address issues of SLR and permanence
- Manage risks
- Grouping of projects to cut cost
- Release with Methodology

# Are Wetland GHG Offsets Attractive?

- Tidal wetland and seagrass restoration creates “co-benefits”
- Climate mitigation and corporate social responsibility are primary reasons to buy
- AFOLU offsets sell at a premium
- Wetlands offsets could be highly charismatic in the marketplace

“We like projects that have co-benefits and side benefits in addition to just pure GHG benefits... and we’re really drawn to reforestation projects in particular that have watershed protection, habitat rehabilitation as well as a GHG component.” – Bob Antonoplis, Assistant General Counsel for The Walt Disney Company

# Value of CO<sub>2</sub> for Marsh Restoration

(3 tons CO<sub>2</sub>/yr/acre for 50 years)

| Price per ton CO <sub>2</sub> | 100 acres | 1000 acres  |
|-------------------------------|-----------|-------------|
| \$5.00                        | \$75,000  | \$750,000   |
| \$10.00                       | \$150,000 | \$1,500,000 |
| \$20.00                       | \$300,000 | \$3,000,000 |
| \$40.00                       | \$600,000 | \$6,000,000 |

Before subtracting accounting costs  
Adapted from a slide by Brian Needelman, UMD

# Carbon Finance Discussion

- Price of carbon too low to fully support activities
  - SCC \$40
  - Voluntary Market \$4-5
  - CA ARB \$8-12
- Cost-sharing common in land use sector projects
- 'Grouping' projects may reduce carbon accounting costs, achieve economies of scale
- Offset income could support typically underfunded project elements – e.g. monitoring and adaptive management
- Need creative strategies to maximize carbon benefits while increasing conservation actions

# Other Blue Carbon Approaches

- Integrate blue carbon into regulatory and policy approaches
- Make recommendations for improved coastal management
- Explore offsets with lower transaction costs – outside existing standards
- Strengthen funding requests
- *Creative approaches needed*

*Goal: Good understanding of full value of habitats to better promote restoration/conservation*

# Analysis of Federal Policies

- Examined where coastal blue carbon could be included in implementation of Clean Water Act, Natural Resources Damage Assessment, and Coastal Zone Management Act
- Determined: No new regulations or statutory changes needed
- **Incorporation of carbon services in these policies could lead to more habitat conservation**
